1 Overview

1.1 Introduction

This guide is intended to be used by software developers and/or systems integrators that wish to communicate with Mindray patient monitor and life support (PMLS) devices. The PMLS Systems can communicate results and alerts data to other systems such as clinical IT systems. This is done using an HL7 based protocol based on the Integrating the Healthcare Enterprise (IHE) Patient Care Devices (PCD) Device to Enterprise Communication (DEC) profile. This document provides specifics on how the PMLS devices implement this profile.

2 Message Frame

MLLP is the Minimal Lower Layer Protocol which is used by HL7 for delimiting the start and end of a message.And there are two kinds of message frame.

2.1 Ethernet frame

- The Ethernet protocol has a built in CRC check so that each message does not need any application level checking for transmission errors.
- The frame of an MLLP message for Ethernet is:

  <SB> + <Message> + <EB> + <CR>

Where:

<SB> = Start Block (0x0B (VT))

<Message> = IHE-PCD compliant HL7 Message

<EB> = End Block (0x1C (FS))

<CR> = Carriage Return (0x0D (CR))

- A typical message will look like:

SB	NETWORK EXPORT MESSAGE (IHE-PCD HL7)	EB	CR

2.2 RS-232 frame

- The frame of an MLLP message for RS-232 is:

  <SB> + <Message> + <CRC> + <EB> + <CR>

Where:

<SB> = Start Block (0x0B (VT))

<Message> = Optimized IHE-PCD HL7 Message

<EB> = End Block (0x1C (FS))

<CR> = Carriage return (0x0D (CR))

<CRC> = 16 bit CRC in 4 ASCII characters (see Appendix).

- A 16-bit CRC checksum of the message content (not including the MLLP framing information (SB, EB, and CR)) is appended at the end of any message. For more information refer to Appendix.
- A typical message will look like:

- RS-232 frame is only supported by A Series - Anesthesia machine.

Please Note:

The OBX-11 field will be filled in with 'R' for unconfirmed observations. These are observations that are machine measured and not confirmed by a clinician. Values confirmed by a clinician will be filled in with an 'F'. An example of this would be weight since it is entered by the clinician. When sending an invalid value, the A Series will set the OBX-2 "Observation Type" and OBX-5 "Observation Value" blank, OBX-8 to "INV", and OBX-11 to "X".

OBX-2 can be set to NM, SN (for I: E) or CWE.

- NM is used for most observations including measurements and settings.

- CWE is used for Vent Mode, and System Status where OBX-5 is not a simple number but an expression, for example “50013^MNDRY_MODE_PCV_PLUS_VG^MNDRY99”.

- SN (“Structured Numeric” data type) is used to send the I:E ratio data, which means sending both the ‘I’ and the ‘E’ in one OBX segment. For example a ratio of 1:2 would be sent as: OBX|464|**SN**|20000^MDC_RATIO_IE_SETTING^99MNDRY|1.3.2.20000|**^1^:^2**|262656^MDC_DIM_DIMLESS^MDC|||||F|||20120101000721-0500|

3.1.7 Waveform Block OBX Segment

3.1.7.1 Notes on the OBX-4 Sub-ID

OBX-4 for the waveform data OBX segment follows the standard IHE format of M.V.C.I, where M = System, V = Virtual Device, V = Channel, I = Metric. I is set to the OBX-3.1 value for the parameter. The following OBXs in the message that contain specifications for the waveform data follow the format of M.V.C.I.F, where F is an incrementing integer for each new OBX. The M.V.C.I component is identical to the value in the waveform data OBX. This allows the specifications to be associated with the waveform data OBX.

Appendix A –CRC Calculation

A.1 Overview

As depicted in section 2.1.1.1 the Serial Protocol uses a CRC based on the IETF RFC 1171 for HDLC framing. The CRC is calculated to 16 bits on the HL7 message and does not include the MLLP framing characters. It is inserted towards the end of the Serial export message using 4 ASCII characters in Hex. For example if the CRC is 0x1F2Eh, the CRC is inserted as 1F2E.

A.2 CRC Calculation Guidance

Below is a C++ class for reference that performs the CRC based on the IETF RFC 1171 for HDLC framing. It can easily be converted into a C function if needed.

```
class CRC
{
   private:
      static unsigned short s_CRCTable[256];
      unsigned short m_Value;

   public:
      CRC():m_Value(0){}
      unsigned short GetValue() const { return m_Value;}
      void Reset() {m_Value = 0;}
      void Calculate( const unsigned char* data, size_t length);
};
